Mechanical Design of an Ultrasonic Integrity Verifier

<p>Position for:</p> <p>Trainee</p>	<p>As the science and knowledge service of the Commission, the mission of Joint Research Centre is to support EU policies with independent evidence throughout the whole policy cycle.</p> <p>The JRC is located in 5 Member States (Belgium, Germany, Italy, the Netherlands and Spain). Further information is available at: http://www.jrc.ec.europa.eu</p> <p>Short description of activity:</p> <p><i>The trainee position is available at the Nuclear Security Unit. The unit focus is on state of the art enabling research, the use of specific technology, development of instruments and methods, delivering technical services and training in the domain of nuclear safeguards, non-proliferation and nuclear security. In this way, the unit supports the verification of international treaties and agreements related to nuclear safeguards and non-proliferation.</i></p> <p><i>The Nuclear Security Unit develops Sealing and Identification Techniques for nuclear safeguards, especially underwater and dry storage casks.</i></p> <p><i>In this field of application, there is an urgent need for sealing system that can be installed and possibly removed by an operator without the physical presence of nuclear inspectors.</i></p> <p><i>In this framework the Seal Team has patented an innovative sealing system composed of a sealing bolt including various features (ultrasonic identity & integrity, connection via an optical fiber to an electronic Active Optical Loop Seal, connection to an inspector cabinet, ...) and various additional components. The aim of this traineeship is the mechanical design of the cask verification system to be used before installation of the seal to verify the integrity of the cask. All the parameters have already been defined by a previous trainee (US transducers, positions, angles, distances, ...). Following the design phase, samples will be 3D printed and then manufactured by colleagues in the workshop and tested by the trainee.</i></p> <p><i>The trainee will be part of a small team of specialists and will be guided through the various aspects of the project. The lab has several CNC machines in its workshop, 3D printers and testing machines (vibration, drop, temperature, humidity, ...). The lab is using SolidWorks CAD software for design and finite elements studies.</i></p>
